INTRODUCTION

“Diversity” is the one word that best describes the physical and biological characteristics of New Hampshire. Our state has tall mountains with alpine plant and animal communities, forested valleys, fast-flowing streams, large lakes and small ponds, species-rich wetlands, and a coast with a large estuary and sandy beaches. Diversity also describes the type of fishing anglers will enjoy in New Hampshire.

An Angler’s Guide to Freshwater Fishing in New Hampshire is a guide to some of the state’s best freshwater lakes, ponds, rivers, and streams. With this booklet, you can find mountain streams inhabited by brook trout, shallow ponds loaded with sunfish, deep lakes with landlocked salmon, and more.

Put *An Angler’s Guide to Freshwater Fishing in New Hampshire* in your tackle box, glove compartment, fishing vest, or anywhere you can reference it easily—and enjoy the many freshwater fishing opportunities the Granite State has to offer.

Accessible Fishing Access Sites

The New Hampshire Fish and Game Department (NHFG) is pleased to provide access opportunities for people with varied abilities. In that spirit, the Department is working to broaden recreational opportunities for disabled persons.

There are many other access sites around the state that can be used by people with disabilities. Some are owned by municipalities, organizations, or other entities. Below is a partial list of access sites that offer fishing opportunities for people with physical disabilities.

- **South Pond, Stark** (US Forest Service, fee) Features an 888-foot long fishermen's trail that's accessible by people with disabilities. Located in the South Pond Recreational Area.
- **Archery Pond, Allenstown** (NHFG, no fee) Fly-fishing only pond in Bear Brook State Park offers good trout fishing for people with disabilities.
- **Hot Hole Pond, Concord** (NHFG, no fee) Features an accessible fishing pier in a popular trout fishery.
- **Turtle-town Pond, Concord** (NHFG, no fee) Universally designed fishing pier accesses good warmwater fishing.
- **Pemigewasset Lake, New Hampton** (NHFG, no fee) Universally designed fishing pier – good warmwater fishing.
- **Merrimack River, Concord** (NHFG, no fee) Three universally designed fishing piers (two suitable for fly-fishing) over some of the most productive water in this area of the river. Off Second Street in Concord.

To find other accessible fishing sites in New Hampshire, please visit: fishnh.com/access.

Let's Get the Lead Out!

Loons and other diving waterbirds can die from lead poisoning after swallowing lead fishing sinkers and jigs lost by anglers.

Biologists have studied the effects of lead sinkers and jigs on waterbirds since the 1970s. Their ongoing research has documented that in the Northeast United States and Canada, where loons breed, lead sinkers or jigs can account for 10 to 50 percent of dead adult loons found by researchers.

A state law prohibits the use of lead sinkers and jigs in all fresh waters in New Hampshire. Specifically, the ban prohibits the use of lead sinkers and jigs weighing 1 ounce or less. These items may not be sold in New Hampshire.

What You Can Do

- Use non-lead sinkers and jigs. **IT'S THE LAW.**
- Spread the word. Tell other anglers about the problem with lead.
- Dispose of old lead sinkers and jigs properly. Drop off at local household hazardous waste collection days or at Fish and Game Headquarters.
- For up-to-date information on lead tackle restrictions, visit **fishleadfree.org**.

Angler's Code

Practice Safe Fishing: Be careful when casting and handling fish hooks. Wear a life jacket when in a boat or near deep water.

Be Courteous: Don't litter. Pick up all extra line, leftover bait, and other trash. Respect the rights of other anglers, and always give the other person plenty of room to fish. Respect the wishes of private property owners.

Respect the Outdoors: Observe, but do not disturb wildlife. Keep only the number of fish for which you have a need. Release fish right away if you do not plan to eat them.

Obey Fishing Laws: Buy a license and know the kind, number, and size of fish you're allowed to keep. Report fishing law violations to Operation Game Thief at 1(800) 344-4262 or online at fishnh.com/ogt.

Consult the N.H. Fishing Digest for Current Rules

Fishing regulations may change from one water body to the next, and from one year to another. Some streams and ponds, for example, are fly-fishing only, catch-and-release, or have special length limits and bag limits.

To ensure that you abide by the law when you're fishing, pick up the current edition of the *N.H. Freshwater Fishing Digest* published by the New Hampshire Fish and Game Department. Copies are available at all Fish and Game offices, license agents, and at fishnh.com.

See Fish Up Close...

Visit New Hampshire Fish and Game's Hatcheries

From Coos County to Hillsborough County, the New Hampshire Fish and Game Department operates six fish hatcheries that contribute significantly to the fishing pleasure of resident and non-resident anglers. In addition to raising fish for stocking the state's many water bodies, hatcheries offer people an opportunity to view coldwater fishes and learn about fisheries management.

The hatcheries are open to the public year-round, M-F, 8:00 a.m. to 4:00 p.m.

Berlin Hatchery

York Pond Road, Berlin
(603) 449-3412

Twin Mountain Hatchery

Route 3, Carroll
(603) 846-5429

Milford Hatchery

North River Road, Milford
(603) 673-1416

Warren Hatchery

Fish Hatchery Road, Warren
(603) 764-8593

New Hampton Hatchery

Main Street, New Hampton
(603) 744-3709

Powder Mill Hatchery

288 Merrymeeting Road
New Durham
(603) 859-2041

For more information visit: ***fishnh.com***

Discover Fish and Game's Education Centers

Discovery Room

N.H. Fish and Game Department
11 Hazen Dr., Concord
(603) 271-3211
Open year-round, M-F, 8:30 a.m.-
4:00 p.m., except for holidays.
Groups by appointment.

Great Bay Discovery Center

89 Depot Road, Greenland, NH
(603) 778-0015
Open to the public 10 a.m.-4 p.m.,
Wed.-Sun, May-Sept. Open week-
ends only in October.
*The grounds and boardwalk are
open year round, dawn to dusk.
Groups by appointment.*

BROOK TROUT

Salvelinus fontinalis

Also called “squaretail” or “speckled trout,” the brook trout requires well-oxygenated cold water, 68 degrees or less. It can be found in meadow brooks, rivers, streams, and ponds. Native to eastern North America, the brookie is New Hampshire’s official state fish and favorite game fish. It is easily caught with flies or small spinners. Earthworms are the most effective live bait.

In the wild, brook trout spawn in the fall. They head up streams and seek gravel-bottom sections, where the female digs small spawning pits by lying on her side and vibrating her tail rapidly. Meanwhile, the males court the female by approaching and touching her side. When ready, the female drops to the deepest part of the pit (called a redd) and spawns with a male, depositing 40 to 80 eggs. Both partners spawn repeatedly during a season. In hatcheries, spawning times can be manipulated by temperature, day length, and hormone injections.

© Fish illustrations are public domain; brook trout, brown trout, rainbow trout, smallmouth bass, largemouth bass, brown bullhead, white perch, bluegill, pumpkinseed, black crappie, yellow perch, and chain pickerel are by Duane Raver; lake trout, rainbow smelt, landlocked salmon, northern pike, walleye, rock bass and burbot are by Ellen Edmonson.

Brook trout are voracious carnivores, feeding on all sorts of aquatic insects and other invertebrates. As stream dwellers, they eat many terrestrial insects that fall into the water. Brook trout also occasionally eat fish and other vertebrates, such as salamanders, tadpoles, snakes, and other small animals.

Brook trout account for approximately 50 percent of all yearling trout stocked each year in the state's water bodies. Wild populations of brook trout can be found in many northern and mountain streams. Due to the low levels of nutrients in these streams, the trout are short-lived and rarely exceed 6 inches in length. An 8- or 9-inch brookie in these streams is a real trophy!

Close to fifty remote ponds are stocked with fingerling brook trout and are managed for put-grow-and-take. It is possible to catch a 4-pound trout in some of these ponds, due to the light fishing pressure they receive.

Eastern Brook Trout

JOINT VENTURE

A Fish Habitat Partnership

The Eastern Brook Trout Joint Venture fosters a conservation strategy for restoring healthy, fishable populations of brook trout throughout their eastern native range. Active partners include fish and wildlife agencies from 17 states, federal agencies, conservation organizations, and academic institutions. Each of the Joint Venture states has a specialized plan, based on that state's existing brook trout populations and dominant threats, to help prioritize protection and restoration efforts. In New Hampshire, one of the priorities has been the protection and restoration of brook trout habitat. Learn more at easternbrooktrout.org.

LAKE TROUT

Salvelinus namaycush

The lake trout is native to several of our deep, coldwater lakes. Through past hatchery stocking, the range of the “laker” or “togue” has been expanded to several other lakes. Today, they are managed as a self-sustaining fishery. The ideal temperature for lake trout is near 50 degrees. That means they will often be found on or near the bottom of a water body.

The lake trout is prized as a game fish mainly because of its size and power. Fish weighing between 3 and 6 pounds are caught regularly, and individuals as large as 10 pounds are not uncommon. In early spring, just after “ice out,” it is generally taken by trolling near the surface with spoons or wobblers and natural bait, such as shiners or suckers. In summer, troll deep with wire or lead core lines or downriggers, with sewn-on bait or spoons. The key word in trolling for lake trout is “slow”.

Winter ice fishing in New Hampshire on the big lakes centers around bobhouse colonies. Jigging with lures or cut sucker bait are effective ways of catching lakers through the ice.

RAINBOW SMELT

Osmerus mordax

The rainbow smelt is an anadromous species living in saltwater for part of its life and reproducing in freshwater. In New Hampshire, smelt can also be found landlocked in larger freshwater lakes. The smelt is a slender, elongated fish with a bright silvery stripe along the side of its body, presence of an adipose fin, deeply forked tail, and large teeth. Upon removal from the water, smelt give off a cucumber-like odor. Rainbow smelt are sometimes called icefish or frostfish.

Smelt are an essential forage fish for landlocked salmon, lake trout, and other game fish, as well as being an important species for commercial fishermen in Great Bay. Smelt are taken by commercial fishermen by netting under the ice. Anglers take smelt through the ice with hook and line and by dip netting during the spawning run. Smelt are also the preferred bait when ice fishing for lake trout.

Rainbow smelt feed on mysis, a freshwater shrimp, small crustaceans, small fish, and the eggs of other fish.

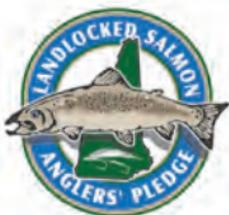

LANDLOCKED SALMON

Salmo salar

The landlocked salmon was originally an ocean fish (Atlantic salmon) that became trapped in inland lakes. They were introduced in the state from New Brunswick, Canada, in 1866. They are stocked in larger lakes and prefer water temperatures in the mid-50s. During summer, landlocked salmon are found below the thermocline – the area of water where temperatures drop rapidly – usually 30 feet below the surface.

Early spring and the end of September are the best times to catch salmon. In the spring, they follow smelt when these bait fish spawn. During the day, salmon cruise the shallow water of lakes near stream mouths. Salmon can be caught on streamer flies trolled close behind a boat at a rapid pace. Trolled spoons, wobblers, and sewn-on bait are also excellent.

Landlocked Salmon Angler's Pledge

By pledging to be dedicated stewards, landlocked salmon anglers can make a critical difference in sustaining this valuable fishery.

Help prevent hook wounding. Learn more at:
fishnh.com/fishing/salmon-pledge.html

BROWN TROUT

Salmo trutta

A native of western Europe and the British Isles, the brown trout was first introduced in New Hampshire in 1885. Like the rainbow trout, it adapts more easily to warm water than the brook trout. Temperatures between 65 and 75 degrees are best for the brown trout. Although it does well in turbulent, fast-flowing streams, the brown trout is characteristically found in deep, quiet pools, or in the lower sections of streams that are slower moving and usually warmer.

Brown trout are hard to catch and, therefore, are difficult to “fish out.” They are able to withstand heavy fishing pressure. After reaching about 12 inches, they feed almost solely on baitfish during twilight and nighttime hours. Live bait, spinners, and flies fished at dusk are equally as effective on brown trout.

The brown trout caught in New Hampshire water bodies range between 7 and 14 inches in length and usually weigh less than a pound. However, 2- to 4-pound fish are not uncommon, particularly in larger water bodies.

RAINBOW TROUT

Oncorhynchus mykiss

The rainbow trout thrives best in cold water, but it can withstand temperatures up to 77 degrees if the water is well aerated. This species is well adapted to lakes and streams.

Introduced to New Hampshire in 1878 from California, the rainbow is a popular sport fish among many anglers. When hooked, it will jump repeatedly out of the water before coming to the net. Any trout fishing method can be used to catch rainbows. Spinners, flies, small spoons, and bait are effective.

Because natural reproduction is minimal in New Hampshire; the rainbow trout fishery is maintained primarily by hatchery production. They are stocked annually by the Fish and Game Department in many suitable water bodies throughout the state.

The usual size of rainbows found in streams and ponds is between 6 and 12 inches and less than 1 pound. In larger lakes, however, 3- to 5-pound rainbows can be caught.

SMALLMOUTH BASS

Micropterus dolomieu

The smallmouth bass is a member of the black bass family. It prefers lakes and streams with cool, clear water, a gravelly or rocky bottom, and scant vegetation. One might expect to find this fish in lakes near submerged reefs or ledges in water 3 to 20 feet deep.

All bass are spring spawners, with nest building occurring in mid-May when water temperatures are in the high 50s and low 60s. Spawning smallmouths are found in areas with gravel and boulder bottoms. In the summer, they will stay in deeper water than largemouths because they like the cooler temperatures. Look for smallmouths along rocks near dropoffs. On summer nights, smallmouths will head to shallow water looking for crayfish.

Several methods may be used to take smallmouths, including fly casting with floating bugs and trolling or casting with a plug or spinner. The most common and successful method is still fishing with live bait such as worms, minnows, hellgrammites, and crayfish. Fall brings them back into shallower water, which awakens a drive to eat and put on weight for the winter.

LARGEMOUTH BASS

Micropterus salmoides

The largemouth bass closely resembles the smallmouth in general appearance. The jaw of the largemouth, when the mouth is closed, extends well beyond the eye. The largemouth also exhibits a horizontal dark band or stripe along its side.

In contrast to the smallmouth bass, the largemouth thrives best in warm, shallow, mud-bottomed lakes, ponds, or streams with plenty of vegetation. It is a solitary fish. Most of its time is spent lurking among aquatic vegetation, beneath an overhanging branch, or under a brush-covered bank, waiting for prey to swim by. Its diet consists of frogs and bait fish, though almost anything can become a meal: snakes, mice, snails, and worms.

Though not as spectacular a fighter as the smallmouth, the largemouth is best caught by fishing the open places among lily pads, around sunken logs or stumps, or along a stream bank. Surface poppers and plastic worm lures probably take most bass, but live minnows and crayfish, artificial flies and streamers, and trolled lures will all work.

BROWN BULLHEAD

Ameiurus nebulosus

The brown bullhead, also known as “horned pout,” is found chiefly in small lakes, ponds, and the sluggish parts of streams and rivers. It also inhabits large lakes, where it is most abundant in sheltered bays.

A brown bullhead prefers a mud bottom, but does well with or without vegetative growth. It is a hardy fish and can survive extreme conditions that cause other fish to perish, such as water temperatures of 90 degrees and oxygen levels as low as one part per million.

The brown bullhead is a favorite among New Hampshire anglers. It can be caught by any angler, skilled or unskilled, using most any type of tackle. Earthworms are probably the most common bait. Yet live minnows, crayfish, corn kernels, hellgrammites and dough balls are also effective if fished near the bottom. Fishing in the evening, at night, or in the early morning hours is usually best. The brown bullhead, many claim, is the best eating fish found anywhere.

WHITE PERCH

Morone americana

Although superficially resembling both the yellow perch and black basses of the sunfish family, this species is more closely related to the sea basses. It is typically a silvery to silvery-green fish, dark green on top and light underneath. The spines on the back are sharp, and these fish should be handled with care.

White perch originally ranged in coastal waters from South Carolina to Nova Scotia. It has been successfully introduced into many New Hampshire inland waters.

The white perch is a determined fighter when hooked, and one of our tastier and more popular panfishes. It is an easy fish to catch and will accept most any kind of bait: worms, live minnows, artificial flies, and spoons. White perch fishing is best at dusk, when schools of feeding fish tend to move into shallows near shore. This fish, unfortunately, often becomes overcrowded and stunted in fresh water.

CHAIN PICKEREL

Esox niger

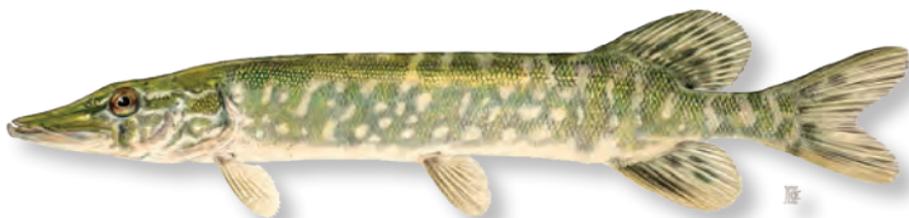

Like other members of the pike family, the chain pickerel (also called Eastern pickerel), has a slender, elongated body, large mouth with formidable teeth, and dorsal and anal fins far back near the tail. A characteristic pattern of dark, chain-like markings on the sides distinguishes it from other members of the pike family.

Any quiet, shallow water with a mud bottom, an abundance of aquatic vegetation, and food fishes is ideal habitat for the chain pickerel. Their optimum water temperature is apparently 80 to 90 degrees. Pickerel like to hide in vegetation waiting for a meal to swim by.

The chain pickerel is a voracious carnivore. Its diet includes golden shiners, brown bullheads, yellow perch, and sunfish. The pickerel's popularity peaks during the winter, when considerable numbers are taken with ease through the ice. The usual method is fishing with a "tip-up" device, using a live minnow. Pickerel fishing in open water is also profitable. Trolling, still fishing with a live minnow or frog, or spincasting with plugs, spinners, or spoons all produce good results.

NORTHERN PIKE

Esox lucius

The northern pike is a fast-growing, voracious predator that is highly prized as a sport fish. It is gaining popularity among anglers in New Hampshire, particularly those who want to catch a trophy-sized fish through the ice. Northern pike can only be found in a few select water bodies in the state.

Northern pike may be distinguished from chain pickerel by the scaleless lower halves of the gill plates and the yellowish bean-shaped marks on its sides. Northerns can grow much larger than pickerel.

A northern pike, like a pickerel, eats other fish. As the pike gets bigger, other animals such as frogs, ducklings, and even small muskrats are also consumed. Although the northern pike prefers cooler waters than the pickerel, both fish are usually found in quiet, shallow, vegetated areas.

Northern pike are generally fished in the same manner as chain pickerel.

WALLEYE

Sander vitreus

A member of the perch, not the pike, family, the walleye is sometimes mistakenly called “walleyed pike.” Not native to New Hampshire, this fish occurs in the Connecticut, Merrimack, and Contoocook Rivers.

The walleye has a long cylindrical body, elongated conical head, large mouth with sharp canine teeth, large milky eyes and two well-separated dorsal fins — one with sharp spines, the other soft-rayed.

Both lakes and large streams serve as walleye habitat. It thrives best in clean water and prefers areas with a firm bottom, such as gravel or bedrock. It is a nocturnal fish, moving onto sandbars or rocky shoals at night to feed and remaining in deeper water during the day.

The fish is prized by sports fishermen throughout its range. Angling methods include still fishing with live minnows or by trolling or casting almost any artificial lure, spoon, spinner or minnow and spinner combination. The most productive fishing is generally in the evening and early morning. Spring fishing below dams and at the mouths of tributaries can also be productive.

YELLOW PERCH

Perca flavescens

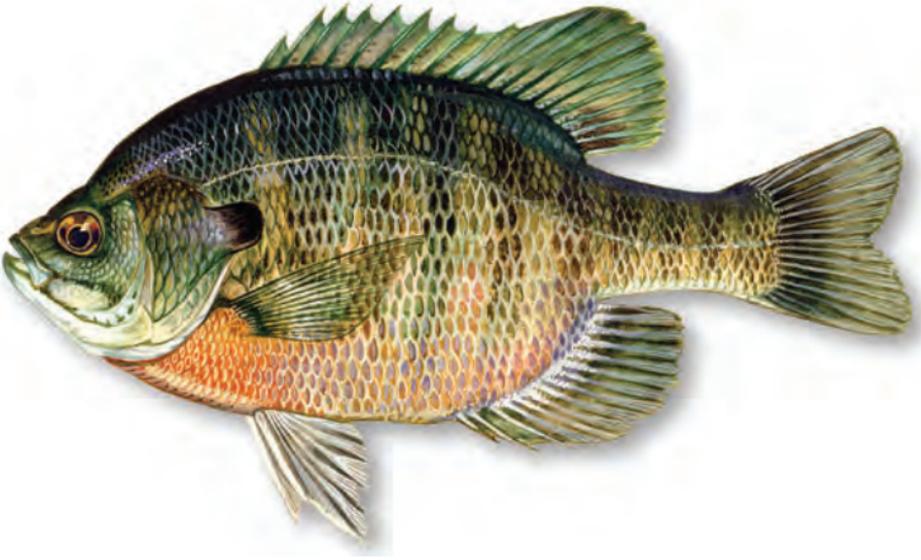

The yellow perch is easily recognized by its golden-yellow body crossed by six to eight broad dark vertical bands. In New Hampshire, it occurs in any warmwater environment. As a rule, they do not occur where there is a strong current.

Yellow perch are a schooling fish and can be located in relatively shallow water. They spawn in April or early May in sheltered coves and backwaters. These fish feed mainly on small aquatic insects, crustaceans, and small fishes.

Yellow perch appeal to young and old anglers. They are not difficult to catch and can be taken year round. In the summer, an artificial fly, spinning lure, trolling spoon, and live minnow work well. In winter, the tip-up or handline with live minnows are good methods for catching yellow perch. The white meat is firm, very good, and fillets nicely. Fishing for yellow perch is fun and encouraged. They often compete with game fish for habitat and need to be harvested to keep numbers manageable.

BLUEGILL

Lepomis macrochirus

The bluegill's distinguishing characteristics are the conspicuous dark blotches at the back of the soft-rayed portion of the dorsal fin; the large, square-shaped, blue-black flap behind the eye; and the slate-blue lower jaw and cheek.

Not a New Hampshire native, the bluegill, sometimes called "kibbee," has extended its range into the Granite State. The bluegill is at home in quiet, warm, weedy waters similar to those inhabited by other sunfish, such as the pumpkinseed.

This is a highly valued panfish throughout much of its range. Like other sunfish, the bluegill is easily caught with simple tackle. Small flies and panfish poppers and live bait such as grubs and worms all work well.

PUMPKINSEED

Lepomis gibbosus

Like the bluegill, the pumpkinseed lives in many of New Hampshire's lakes, ponds, and streams. The pumpkinseed can be distinguished from the bluegill by the bright orange spot at the tip of the ear flap and lack of dark spot on the soft portion of the dorsal fin. Breeding males are especially colorful with iridescent blue radiating lines on their cheeks and gill covers.

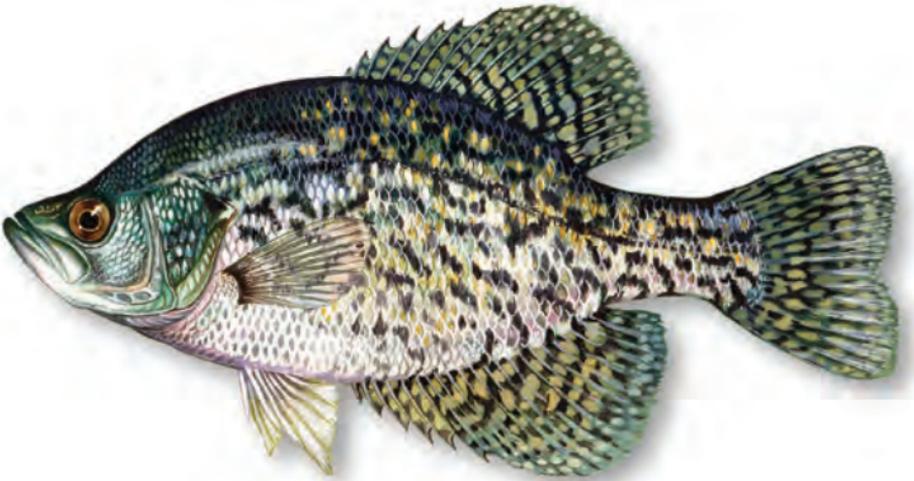

The preferred habitat of the pumpkinseed is slow-moving water and protected coves with a mucky or sandy substrate and beds of submerged aquatic vegetation.

Pumpkinseeds spawn from May into August, frequently nesting in groups of bluegill colonies, which can be seen close to shore. The male guards the nest and the newly hatched fry for a week.

The preferred food of the pumpkinseed is aquatic insects, snails, small fish, and fish eggs.

BLACK CRAPPIE

Pomoxis nigromaculatus

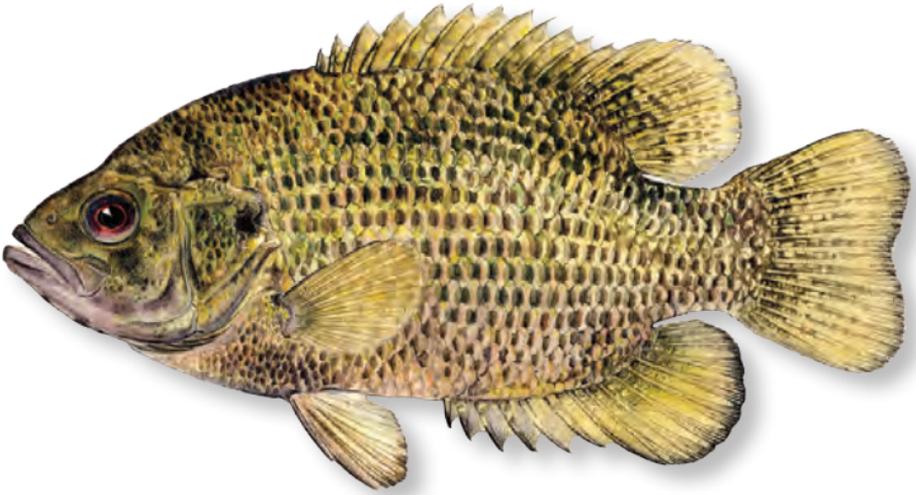

The body of the black crappie, or “calico bass,” is deep and thick. The forehead is depressed, resulting in a noticeably turned-up snout. Crappies are an attractive silvery fish with numerous black or black-green mottlings scattered over its body and fins.

Introduced to New Hampshire waters, crappies are now commonly found from the central lakes region east to the Maine border, west to the Connecticut River, and south to the Massachusetts border. As its range has expanded, the black crappie has become a favorite of New Hampshire anglers.

It inhabits the quiet waters of lakes, ponds, and rivers with aquatic vegetation. Small jigs or minnows fished in open water or through the ice are successful tactics to catch crappies. Crappies are low-light feeders; try late afternoon to dark and early morning for the best action. One- to two-pound black crappies are common in many New Hampshire waters.

ROCK BASS

Ambloplites rupestris

The rock bass was originally a resident of the Mississippi Valley, Great Lakes, and Lake Champlain. Its range has expanded into New Hampshire waters. Rock bass can be found along rocky shores in lakes and rocky streams – some of the same habitat of the smallmouth bass – and can compete heavily with the smallie for food.

The rock bass is a member of the sunfish family, but is easily distinguished from its smaller cousin by the horizontal stripes on its side and large blood-red eye.

Rock bass can be caught with a variety of tackle. Small lures, flies, and jigs work well. Small bass lures are also effective. The rock bass is a strong and determined fighter when hooked.

Rock bass rarely exceed 12 inches, and the average weight is about half a pound.

BURBOT (CUSK)

Lota lota

Burbot, known by a variety of names including ling, cusk, lawyer, and eelpout, are the sole freshwater representative of the cod family. The almost eel-shaped burbot has a broad flattened head with a large mouth and single barbelle beneath the lower lip.

Burbot can be found in large, cold, deep lakes. They go into semi-hibernation during the hot summer months.

Burbot are particularly lively when the ice cover forms. Ice anglers have long sought burbot for its firm, white flesh sometimes referred to as “poor man’s lobster.” The usual method of fishing for it is through the ice with a baited set line. Common bait used is a minnow or cut-bait that is fished on the bottom. Since burbot feed actively after dark, lines are generally left unattended through the night.

Trophy Fish and Catch/Release Program

If you believe a big fish you catch measures up to other large fish caught in New Hampshire, you should consider entering it into the Fish and Game Department's **Trophy Fish and Catch/Release Program**.

This program recognizes the skilled and lucky anglers who catch exceptionally large fish in the state. The fish must exceed the minimum weight listed below. To enter one in the catch-and-release category, a fish must meet the minimum length listed below.

FRESHWATER FISH

<i>Species</i>	<i>Minimum Weight</i>	<i>Minimum Length</i>
Black crappie	2 lbs.	14"
Bluegill	1 lb.	10"
Brook trout	2 lbs.	16"
Brown bullhead	2 lbs.	14"
Brown trout	5 lbs.	25"
Chain pickerel	4 lbs.	24"
Channel catfish	6 lbs.	24"
Common carp	20 lbs.	30"
Cusk (burbot)	6 lbs.	28"
Fallfish	2 lbs.	15"
Lake trout	10 lbs.	30"
Landlocked salmon	5 lbs.	24"
Largemouth bass	5 lbs.	20"
Northern pike	15 lbs.	38"
Pumpkinseed	10 oz.	8"
Rainbow trout	4 lbs.	20"
Rock bass	1 lb.	10"
Smallmouth bass	4 lbs.	19"
Walleye	6 lbs.	26"
White catfish	4 lbs.	18"
White perch	2.5 lbs.	15"
Yellow perch	1.5 lbs.	14"

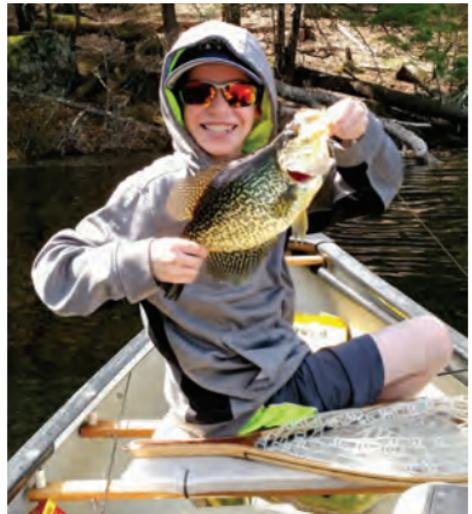

SALTWATER FISH

<i>Species</i>	<i>Minimum Weight</i>	<i>Minimum Length</i>
Atlantic mackerel	3 lbs.	17"
Bluefish	15 lbs.	34"
Cod	40 lbs.	44"
Haddock	10 lbs.	30"
Pollock	30 lbs.	40"
Striped bass	40 lbs.	45"
Winter flounder	2 lbs.	17"

Eligible Categories

The person catching the heaviest fish, or releasing the longest in a particular species category, will receive a certificate. All qualifying applicants will also receive a trophy fish arm patch.

If you catch a fish weighing over the minimum qualifying weight for a particular species category, go to your nearest supermarket which has certified scales. (Do not freeze fish before certifying weight. This will reduce the weight.) Ask the counter person to certify the weight. Send in the certified weight slip along with a completed official entry blank (download one at fishnh.com/fishing/trophy.html).

Lukas Tafe displays his 17" black crappie entry caught and released on Pawtuckaway Lake

Trophy Fish Program Rules

No person shall submit more than three entries for any one species category during a program year. These may include one entry for kept fish and two for catch and release.

1. Weigh the fish as soon as possible on scales certified by the NH Bureau of Weights and Measures. Two witnesses must be present and both must sign the official entry form.
2. Before the entry form can be accepted, the truth of the statement must be attested by a qualified officer such as a notary public, justice of the peace, town clerk, postmaster, member of a state or local law enforcement agency, or NH Fish and Game employee. Note their title and telephone number on the form.
3. All entries must be on an official entry form (download one at **fishnh.com/fishing/trophy.html**). Forms are also available from any conservation officer or by writing to:

Trophy Fish Program

NH Fish and Game Department, Region 2

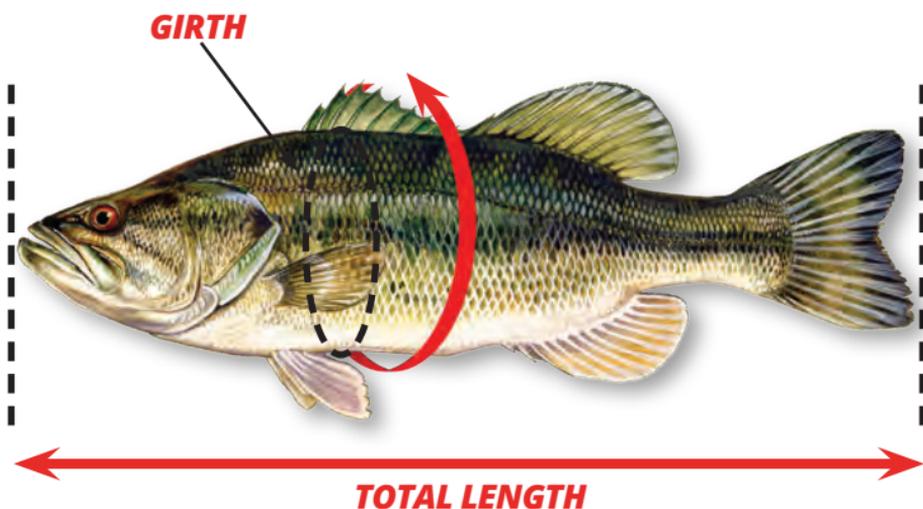

PO Box 417

New Hampton, NH 03256-0417

4. Entrants must have a current resident or nonresident New Hampshire fishing license.
5. Fish must be taken on legal sporting tackle and must be hooked and landed or hooked, boated, and landed in the state of New Hampshire by the entrant during the legal season for the species taken.
6. The Department reserves the right to question any witness, examine the scales used for weighing any entry and to refuse any incomplete application.

7. The program runs from January 1 to December 31 each year. Completed applications must be received within 30 days from date of landing fish. No entries will be accepted later than January 30 for the year prior. Winners will be notified by February 15.
8. A clear side view photo must be submitted with all applications. **Catch and release fish shall be photographed at the site of catch. If the fish shows any signs of improper handling prior to release, it shall be disqualified.**

How to Measure a Trophy Fish

For a Trophy Fish Entry Form, please go to
fishnh.com/fishing/trophy.html

Tips for Releasing Fish

- When returning a fish to the water, time is most important. Land the hooked fish and release it as quickly and carefully as possible. An overplayed fish may become too weak to recover.
- Use a net with a fine mesh when landing the fish. A net is not necessary on small fish. Keep the fish in the water as much as possible. Out of water, a fish suffocates and can be injured.
- Touch the fish as little as possible when removing the hook. Keep fingers, pliers, etc., away from its gills and eyes. Don't squeeze or let it flop on the ground. To calm the fish, hold it gently around the middle and upside down to remove hook.
- Remove the hook with small pliers, or thumb and fore-finger, by shaking and backing the hook out. If the hook cannot be easily removed, cut the leader as close as possible to the hook. The hook will rust or fall out in a short time.

PHOTO © MERRILL DICK / DREAMSTIME.COM

To revive a tired fish, hold it in a swimming position with one hand under the bottom jaw and the other grasping it in front of tail. Move the fish back and forth gently through the water, facing into the current, until it is able to swim away.

Fish Consumption Guidelines

Studies conducted by the N.H. Department of Health and Human Services indicate that some freshwater fish in New Hampshire contain varying levels of **mercury** and pose a potential health risk. Because of this, please follow these general fish consumption guidelines:

- ***Pregnant and nursing women, and women who may become pregnant*** CAN SAFELY EAT one 8-oz. (227 g.) meal per month of freshwater fish.
- ***Children under age 7*** CAN SAFELY EAT one 4-oz. (113 g.) meal per month of freshwater fish.
- ***All other adults and children age 7 and older*** CAN SAFELY EAT four 8-oz. (227 g.) meals per month of freshwater fish.
- ***When eating bass, pickerel, white perch, and yellow perch*** limit consumption to fish 12 inches or less in length while following the above guidelines.
- ***For additional guidelines,*** contact NHDES Environmental Health Program. Although these guidelines have been issued, **the public is encouraged to continue eating fish** as part of a healthy diet.

Let's Go Fishing Program

Whether you're a seasoned angler or a beginner seeking instruction, New Hampshire Fish and Game's **Let's Go Fishing Program** is for you!

Let's Go Fishing Program courses and clinics are offered free of charge by trained volunteer instructors. They share their knowledge and experience of fishing, ethics, responsible outdoor behavior, and aquatic ecology.

Courses and clinics offered by Let's Go Fishing include basic freshwater fishing, saltwater fishing, fly fishing, fly tying, and ice fishing. During the classes, participants learn the basics of fishing and get practical experience while enjoying a hands-on field trip.

Students and instructors enjoying a fly-fishing class.

Let's Go Fishing Volunteers

Join our team by becoming a volunteer instructor and share your love of fishing with others. Let's Go Fishing program volunteers are anglers who are skilled in basic fishing techniques. They are ethical, responsible outdoorsmen and women. They must be committed to passing on their knowledge and following the policies and procedures outlined by the N.H. Fish and Game Department. Once trained, volunteer instructors sign up to teach whole or parts of classes in the disciplines in which they've been trained.

For information, contact N.H. Fish and Game's Aquatic Resources Education Program at (603) 271-3212 or visit: **fishnh.com/fishing/lets-go-fishing.html**.

Interested in setting up a program for your group or organization?

Classes are designed primarily for first time anglers, age eight and older. They range from four to twelve hours, depending on discipline, and are taught statewide, year round, by trained volunteer instructors. For more information, call (603) 271-3212 weekdays 8:00 AM to 4:00 PM, or email aquatic-ed@wildlife.nh.gov or visit **fishnh.com/fishing/lets-go-fishing.html**.

Public Access to New Hampshire's Waters

New Hampshire's lakes, ponds, rivers, and streams are a tremendous public asset to communities and visitors. Providing access to New Hampshire's waters, while safeguarding the environment, is a crucial and challenging task.

The New Hampshire Fish and Game Department's **Statewide Public Access Program** identifies waterbodies needing access from a variety of sources, including a recent statewide public survey, the Public Water Access Advisory Board, interested citizens, and Fish and Game staff.

Once a waterbody is identified, land suitable for an access facility is carefully sought and evaluated. Only then can the Department proceed with plans to buy and develop a site, while protecting that waterbody's environmental conditions. Regional planning commissions, municipal governments, river and lake associations, sporting clubs, and shorefront property owners are a few of the groups that help guide the Department's access initiatives. A variety of state and federal permits must be secured to protect water quality, endangered species, wetlands, and other natural resources before a project can proceed. A management plan is developed for the operation, inspection, maintenance, and enforcement needs of each site.

FFG

Free Fishing Day

On the first Saturday in June and third Saturday in January each year, N.H. Fish and Game offers the public an opportunity to fish for free!

Residents and nonresidents may fish in water bodies throughout the state - both freshwater and saltwater - without purchasing a license.

While the fishing may be free, the day is not a free-for-all. Participants must abide by all current N.H. fishing regulations.

Wildlife and Sport Fish Restoration

*is the most successful
conservation program in America!*

Did you know... fisheries and wildlife work in New Hampshire is funded in part by Federal Aid in Wildlife and Sport Fish Restoration, a program which now provides some \$7.5 million annually to N.H. Fish and Game, or about 23% of the agency's overall budget.

Wildlife and Sport Fish Restoration revenues are collected through excise taxes on fishing rods, reels, lures and other fishing gear, and motorboat fuel, plus sporting arms, ammo, and hunting equipment.

So, when you buy fishing or hunting equipment or motorboat fuel, you are directly contributing to the continuing success of fish and wildlife restoration in New Hampshire! The money is used for scientific research, hatchery operations, and improving public access to boating and fishing waters, as well as outreach efforts such as the "Let's Go Fishing!" program.

**Who pays for conservation?
You do!**
